

Change of PS2-100 pump end color

Change of color for PS2-100 pump ends - blue to black - to improve the UV (ultra violet) color fastness

The color of the material used for the PS2-100 pump end has been changed from a blue color to a black color.

The color change has been made to improve the UV (ultra violet) color fastness. The blue colored material was susceptible to "yellowing" when exposed to sunlight for long periods of time . This "yellowing" did not change the strength or performance of the material, the change has been made purely for aesthetic / visual purposes.

During the change from the blue color to the black color there is a possibility that products, packaging and documents could have mixed black and blue colors.
